ABSTRACT OF THE DISCLOSURE

The present invention provides a game for throwing pottery using clay placed on a potter's wheel with hands on a screen operated by a controller. The game program judges whether or not there has been operating input of direction key buttons or the like for operating hands displayed on the screen as to clay on a potter's wheel displayed on the screen, and in the event that there has been such operating input, determines the magnitude of force corresponding to the input value, calculates the amount of deformation of the clay from the determined magnitude of force, and displays the next image.
